BiodentineTM

Dentine Substitute

Biodentine™: the better standard for younger patients' teeth⁽⁵⁾

1

Maintain pulp vitality

- Biodentine™ is bioactive and promotes the pulp's self healing capacity
- In indirect and direct pulp caps, in partial or total pulpotomies: Biodentine helps you save the pulp every time it's not inflamed
- Its bioactivity allows the apical closure of immature teeth
- Its high pH reduces the risk of bacterial proliferation.

2

Adapted to younger patients

- Biodentine™ is "bulk filled" into the cavity
- It can be left as a temporary restoration for up to 6 months
- The final restoration in the same session is possible, whether a direct composite or a crown
- No post-operative pain and no discolouration
- No need for extra bonding, no extra steps.

Final restoration placed within 6 months

Clinical cases

Pulpotomy

This includes pulpotomy in temporary teeth and partial pulpotomy in permanent teeth. Beside its bioactivity, Biodentine™ fast setting time allows immediate crown restoration. It also allows to make it directly intraorally functional without fear of material deterioration.

Initial clinical view of #55 for a 8-year-old patient.

Pulp exposure during caries curettage necessitating a cervical pulpotomy. Inflammatory, haemorrhagic

Traumatized teeth

Incisors are mostly concerned when it comes to crown fractures. Treatment of these complicated fractures in immature teeth is often a real challenge since the goal is to stimulate the pulp so that the apex can pursue its physiological maturity process. Biodentine™ shows dentine-like mechanical properties, triggers no tooth discoloration and has a short setting time (12 min). It is therefore the material of choice for fragilised immature teeth.

Complicated crown fracture with reversible pulpitis of tooth #21.

Partial pulpotomy of tooth #21. Haemorrhage was

Deep caries treatment

After curettage of caries, the pulp may be seen by transparency or may be exposed. Biodentine™ is a restorative material that can directly be placed on the pulp and is evaluated as superior to MTA, CaOH and formocresol in numerous publications. It offers zero discoloration of teeth, provides an outstanding seal, is easy to handle, sets fast and is antibacterial. You can therefore “bulk fill” Biodentine™ without extra conditioning and bonding.

7 year olds tooth #46 after caries removal, deep cavities in close proximity to the pulp.

Indirect capping of tooth #46 before and after

the course of
essitates carrying out
(vital pulp, non-
stasis possible).

Bulk fill Biodentine™ from the pulp
chamber to the occlusal surface.

One month later, placement of a
paedodontic cap.

For younger patients, historical treatments are not always pulp friendly and show many drawbacks. With Biodentine™, you give children the better care they deserve for their dental treatments, with an easy and fast procedure for you.

Technical Insights

Higher biocompatibility and bioactivity for pediatric indications

- High biocompatibility assessed and evidenced through 500 scientific publications
- Highest amount of calcium and hydroxide ions released upon setting⁽¹⁾
- Induces thick dentine bridge formation⁽²⁾ thanks to largest calcium surface concentration compared to similar dental materials⁽³⁾
- Shows both osteogenic and angiogenic properties to promote pulp and tissues healing⁽⁴⁾
- Calcium silicate based materials show better clinical and radiographic results than Formocresol⁽⁵⁾
- Allows the tooth to grow normally

Immediate post-op X-ray after Biodentine placement. The open apex is clearly visible.

The 9-month follow-up Xray shows the apical closure.

Bulk fill placement for a strong restoration

- Similar mechanical properties as dentine allowing durable bulk fill procedure
- Fast growing mechanical strength allowing solid restoration as soon as Biodentine™ is set
- Shows no depth of cure limitation thanks to its biosilicate chemistry

Product properties designed for paediatric dentistry

- Short setting time of 12 mins allowing rapid placement of a stainless steel crown when necessary
- No post-operative pain⁽⁶⁾
- No tooth discoloration⁽⁷⁾
- Antimicrobial properties thanks to alkaline pH(=12)⁽⁸⁾
